Project Report Digital Literacy

INTRODUCTION:

Hey all, this is Satyendra Thakur. This project is made by me. In this project the topics and area of literacy is digital literacy. Complete project revolves around concepts of digital literacy, digital platform threat, protection methods, professionalism, email etiquettes, ways to represent, and to understand the concept of digital platforms not just to use them. Here you will get the idea of "Understanding over Usage".

In this project I have provided the detailed solutions of the tasks given as well as I tried my level best to make it more meaningful by adding more information and facts.

Each module task teaches something new and result oriented. Each module has different perspective to perceive the digital platforms and how to use them wisely. The overall learning is email etiquettes, digital

collaboration, how to use job search platforms, designing platforms, and much more.

Task1 write up:

In task 1, I made an infographics regarding revealing information about digital literacy and it’s other aspects. The poster I made was made using Canva a well-known platform for it’s unique designs and availability of various options it provides. To make such type of poster I searched canva over google and then signed up then I chose template option in which I chose blank template. Then I searched digital infographics in the search bar under template section from which I could find one interesting. I edited it according to myself by adjusting pictures and fonts it had already.

After that changed background color and added text from text option in the left hand

side.my poster reveals the importance of email etiquettes, what is digital literacy and how it works.

Taks2 write-up:

In this task I explored a lot of portfolio platforms and job searching platform like Kaggle, LinkedIn, Github, etc. to enter in the world of learning with competitive as well as collaborative environment. Accepting challenges and completing them boosts confidence at some other level, also earning badges is something exciting to do.

First I chose LinkedIn, where I had my account already existed. So I updated it. I have my posts, education details, skills, and some other basic details there on the platform. For present and future purpose I would love to use this platform to showcase my actual skills and give my educational and professional updates which will even ultimately help me to land a job as well.

Then I went through Github, where I created my own repositories. ON this platform we set up our own profile then we make new repository where I merged multiple files and folders to make a complete project.

Here we can also code and combine code, outputs, photos, theory and much more at one place. For future use, this platform is useful in making big projects and compile things together with collaboration.

Task3 write-up:

In task 3 we go through the details to work over or to use coding platforms and perform different tasks. I used hacker Rank to perform the python task challenges and I even earned badge for completing that task successfully.

I also created google form in which I put five questions including multiple choice questions and text answer questions with the mark allotment to each question. For this go on google and go for nine dots on the top right

corner. Choose google forms and then choose blank one. Start adding questions to it and also set other settings as per your convenience. This was my very first google form I ever created but I enjoyed it and created it successfully. I also sent the URL link to my friends and also got the responses. Academically these tools are very helpful to create digital quizzes and to complete challenges and also to practice questions honestly.

Task4 write-up:

In my case study of digital literacy I came across a case study of student named arjun who took professional and digital communication very lightly and later on regretted it. When he sent an email to his Faculty for having an opportunity to have internship. However faculty agreed to provide the opportunity to him but he felt the language and warmth difference in reply.

Arjun used short forms in his email which caused him this. At initial stage it does not look that significant but these things make a big difference. So this is how poor digital communication affects connections and real problems.

Arjun could have used it very differently by maintaining professional tone and email etiquettes.

Task5 write-up:
In this task, I researched over different digital threats and most importantly cyberbullying- the very common practice in digital world to harass someone and to troll, blackmail, etc. digitally.

One habit I would like to change about myself in the digital world is to use some platforms more carefully, and to prompt or reply by taking care of timeframe.

Also to maintain my screen time to use mobile and laptop.

Conclusion:

This project is much more than writing theories. It is complete blend of learning carefully and attentively. It provides the real meaning of digital literacy it means digital literacy is not only about to use it but to understand it.

Coming across various digital platforms and using them is necessity for the time in which we are living or simply can not be ignored anyways. To do so it is very important to take care of what we are sharing and feeding ourselves from them.
